Introduction

Server migration projects are complex, risky, and costly if not done well. An architecture firm enlisted 1Office to replace their outdated server. We helped them not only with the replacement but also in implementing a budget-friendly, high-performance hosting solution.

The Challenge

The client required a server capable of handling the demanding data formats and usage of their AutoCAD software and broader software suite within a limited budget. They sought reliability and up time while considering cloud-hosted options, but cost constraints prompted a creative solution from the 1Office team.

The Solution

We scouted for and considered a wide range of cloud and on-premise solutions to meet the client's needs within their budget, discovering a cloud-based solution that could meet all of their requirements. The client was delighted with the proposed solution and how it meet their operational and budgetary needs all at once. We carried out a smooth and secure server replacement to the cloud for them without causing downtime, which proved capable of meeting all of their needs.

To Conclude

The client is delighted with the transformative benefits that the new server has created. For our team, it was a fun and engaging project that drew on our creativity, giving us the opportunity to research, design, and implement a solution tailor-fitted to our client's needs.

"1Office has provided us with our IT support for the past 5 years. The staff are keen to solve any IT issues promptly and with such good service, that we moved our telephone system to be managed by them as well. I would highly recommend."
